Creating Translator Service (based on [Google Translate](#) API)

1. Create translating interface with **React**

   a. A page that has form with 3 fields:

      i. From language

      ii. To language

      iii. Phrase to translate

   b. . Table with all existing translations (from the DB see #2)

2. When the form gets submitted, send the form data to a PHP page

   a. If the translation exist in database (Mysql), return from the db

   b. If not exist, send a request to node app

3. The node app need to translate from Google API

Bonus

- Envelope the application with docker

Good luck.
